Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                              Score

A; Residues: 25-41 <BOU>
C; Comment: Anglotensin I is released from angiotensinogen by renin, which is secreted
e I (angiotensin-converting enzyme), primarily in the lungs.
C; Comment: The release of the amino-terminal residue (Asp-25) from angiotensin I and
sp-1]angiotensin I is converted to angiotensin III by dipeptidyl carboxypeptidase I.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         N;Contains: angiotensin I; angiotensin II; angiotensin III

                                                                                                                                                                                                                                                                                                                                                                      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

These motifs represent a conserved region which affects the DNA polymerase's ability to incorporate didexynucleotides labelled with fluorescein and cyanine family dyes. The method of the invention is useful in reverse transcription/amplification reactions. The method provides improved reverse transcription efficiency at lower enzyme concentrations relative to previous high temperature reverse transcription methods, and provide a wider range of usable salt concentrations. The use of the mutant DNA polymerase provides faster reverse transcription extension rates, and consequently less time is needed for the reaction. This motif is derived from DNA polymerases from Thermotoga species maritima and neopolitana.
                                         Reverse transcribing an RNA, comprises performing a reverse transcriptase polymerase chain reaction amplification of a mixture using a mutant thermoactive DNA polymerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       native forms of motifs derived from DNA polymerases used in to of the invention. The method for reverse transcribing an RNA,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequences given in AAB47791-97 and AAM48259-AAM48270 represent the native forms of motifs derived from DNA polymerases used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 2; Page 4; 23pp; English.

The method of the invention is useful in reverse transcription/amplification reactions. The method provides improved reverse transcription efficiency at lower enzyme concentrations relative to previous high temperature reverse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               treating a transverse conserve. and a mutant thermoactive DNA RNA, a primer, a divalent cation, and a mutant thermoactive DNA polymerase. These mottis represent a conserved region which affects the polymerase. These mottis represent a conserved region which affects the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequences given in AAB47791-97 and AAM48259-AAM48270 represent the native forms of motifs derived from DNA polymerases used in the method of the invention. The method for reverse transcribing an RNA, comprises
                                                                                                                                                                                      Reverse transcribing an RNA, comprises performing a reverse transcriptase polymerase chain reaction amplification of a mixture using a mutant thermoactive DNA polymerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      transverse transcription reaction; fluorescein; cyanine; dye; amplification.

The sequences given in AAB47791-97 and AAM48259-AAM48270 represent the native forms of motifs derived from DNA polymerases used in the method of the invention. The method for reverse transcribing an RNA, comprises of the invention. The transcription reaction mixture which comprises the transcription of the following a transverse transcription reaction mixture which comprises the

Disclosure; Page 7; 23pp; English.

polymortase. These motifs represent a conserved region which affects the DNA polymerase's ability to incorporate dideoxymucleotides labelled with thucrescein and cyanine family dyes. The method of the invention is useful in reverse transcription/amplification reactions. The method

RNA, a primer, a divalent cation, and a mutant thermoactive DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  provides improved reverse transcription efficiency at lower enzyme concentrations relative to previous high temperature reverse transcription methods, and provide a wider range of usable salt concentrations. The use of the mutant DNA polymerase provides faster reverse transcription extension rates, and consequently less time is needed for the reaction.
                                                                                                                                                                                                                                                                                                                                       The C-terminal portion (AAR98144) of the 100 kDa thermostable DNA polymerase (AAR98143) of Thermotoga neapolitana (Tne) includes an O helical region. Tna polymerase is a thermostable enzyme suitable for use in DNA sequencing and amplification reactions. It can be obtd. from host cells, e.g. E. coli, carrying the DNA polymerase gene. Mutants having improved enzymatic properties may also be produced (see also AAR98144-47).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                       Seguence

                                                                                                                                                                                                                                                                                                                                                                           Best
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Site-directed mutagenesis was used to substitute a tyrosine residue for phenylalanine in the O-helical region of Thermotoga neapolitana (The) DNA polymerase. This residue corresponds to position 67 of a C-terminal frayment (see also ANR98144) of the enzyme. As a result of the mutation, the polymerase becomes non-discriminating against non-natural nucleotides such as dideoxynucleotides. The mutant enzyme, which may also incorporate a D323A mutation in the N-terminal portion (see ANR98147), is active and theat stable, and can be used in DNA sequencing and amplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI;

                                                                                                                                                                                                                                                                                       single reading frame. The 3 sequences were compared with known polymerase amino acid sequences and spliced to generate the Tne sequence given in AAW13863. A complete amino acid sequence for polymerase is given in AAW13899.
                                                                                                                                                                                                                                                                                                                             Polypeptide sequences (AAW13862-64) were deduced for all 3 reading frames of a DNA sequence (AAT60031) encoding the C-terminal region, including the O-helix, of the Thermotoga neapolitana (Tne) DNA polymerase. Frameshift errors generated during sequencing of the DNA prevented the entire amino acid sequence being deduced from a
                                                                                                                                                                                                                                                                                                                                                                                                          Mutant DNA polymerase, esp. from Thermotoga - has reduced exonuclease activity or dideoxynucleotide discrimination, useful for DNA amplification, synthesis and sequencing

dideoxynucleotides (ddWTP). They permit sequencing at high temperature; provide strong, clear sequences (increased signal-to-noise ratio); can sequence more than 500 bases; reduce false stops in the sequence ladder; reduce template requirements 10-fold (when using 350 labeling); and also requirements for primer and labeled terminator. They increase sequencing efficiency with structure-containing or GC-rich templates; reduce film exposure times; do not generate sequencing artefacts with homopolymeric sequences and allow quantitation of bases in heterologous mixtures. This sequence represents the Thermotoga neapolitana The polymerase carboxyl terminal which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                        sequencing, amplification and synthesis of DNA by essentially standard methods, also for DNA labeling and for synthesis of CDNA from mRNA templates. (1) have higher thermostability than known enzymes (e.g. 50% retention of activity after 60 min at 90 plusoC), and may be free
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA sequencing, amplification and synthesis methods, using mutant forms of Thermotoga neapolitana polymerase with reduced exonuclease activity or reduced discrimination against dideoxynucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2000-181138/16.

It can be obtd. by expression of a DNA construct (AATS8155) created by restriction digestion of pM284 derived DNA also AAT58135). When expressed in E. coli, The M284 delB showed no detectable polymerase activity. In contrast, a The M284 mutant

Thermostable DNA polymerase from Thermotoga neapolitana - DNA sequencing or for amplification of double stranded DNA N-PSDB; AAT58144. 1997-052374/05 Storts DR; useful

200pp; English.

in

mutagenesis. When expressed in E. coli from a T/ or The M316 produced no detectable polymerase activity. mutant (see also AAW11514) was active. methionine at amino acid position 316 as the initiator methionine. It can be expressed using a DNA construct (AATS8144) created by introducing a Met residue at position 316 (and a corresponding NCOI site) into the native gene (AATS8134) via site-directed mutagenesis. When expressed in E. coli from a T7 or trc promoter. Deletion mutant Tne M316 (AAW11523) of Thermotoga neapolitana DNA polymerase Tne (see also AAW11513) has an artificially created A Tne M284

amplifying the fragment, followed by analysis, identification or typing of the amplicons. The DNA polymerases used are thermostable and the modification or mutation is in the O-helix of the The DNA polymerase. Analysis of polymorphic DNA is particularly used to establish relationships between individuals (forensic or paternity testing), particularly where the polymorphism is a mini- or micro-satellite or short tandem repeat. More generally the DNA polymerase and its mutant form are useful in any process that involves nucleic acid amplification, e.g. identification of pathogens, cancer or genetic diseases (cystic fibrosis, haemophilia, Alzheimer's disease), screening organs or tissues before transplanting, diagnosis, plant breeding.

Note: This sequence is not provided in the specification. It has been created by modifying the wild-type Tne DNA polymerase sequence
                                                                                                                                                                                         Sequences AAW83969 to AAW84011 represent The (Thermotoga neapolitana) DNA polymerase mutants which can be used in the method of the invention of identifying and analysing polymorphic DNA. The method comprises reacting a DNA sample with at least one DNA polymerase having reduced ability to add non-templated nucleotides to the 3'-terminus and amplifying the fragment, followed by analysis, identification or typing of the amplicons. The DNA polymerases used are thermostable and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Tne; O-helix; DNA polymerase; polymorphic; amplicon; thermostable; mutant; forensic; paternity testing; nucleic acid amplification; cancer pathogen; genetic disease; cystic fibrosis; haemophilia; transplanting; Alzheimer's disease; screening; organ; diagnosis; plant breeding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                  neapolitana. The naturally-occurring Met-284 residue becomes the initiating methionine. The mutant enzyme is obtd. by expression of DNA clone pM284 (AAT58135) produced by restriction enzyme digestion of the native gene (AAT58134). The N-terminal deletion eliminates the 5' exonuclease activity of the enzyme. The M284 has a half-life at 97.5 deg C of 18 min compared with 5 min for the native enzyme. Amino acid substns. in the 3' exonuclease domain of The M284 (see also AAM11516-22) yield enzymes ess. suitable for DNA

                       DNA polymerase mutant The M284(D323E) (AAW11515) lacks the N-terminal 283 amino acid residues of the native enzyme (AAW11513) of Thermotoga neapolitana and contains a D323 substn. in the 3' exonuclease domain (numbering according to the native enzyme). It is obtd. by expression of a DNA clone (AAT58136) created by site-directed mutagenesis of construct pM284 (see also AAT58135). The M284(D323E) has no significant 5' or 3' exonuclease activity and has a half-life at 97.5 deg c of 12.5 min compared with 5 min for native The and 8 min for native Taq. It can be used in DNA sequencing reactions and for the amplification of double stranded DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAW11515 standard; Protein; 610 AA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match
Best Local Similarity
                                    DNA polymerase mutant The M284(Y464F) (AAW11517) lacks the N-terminal 283 amino acid residues of the native enzyme (AAW11513) of Thermotoga neapolitana and contains a Y464F substn. in the 3' exonuclease domain (numbering according to the native enzyme). It is obtd. by expression of a DNA clone (AAT58138) created by site-directed mutagenesis of construct pM284 (see also AAT58135). The M284(Y464F) has no significant 5' exonuclease activity and only 1.9% of the native 3' exonuclease activity. Its half-life at 97.5 deg C is 16 min compared with 5 min for native The and 8 min for native Taq. It can be used in DNA sequencing reactions and for the
                                                                                                                                                                                                                                                                     WPI; 1997-052374/05.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
